# 2.2 Descriptive Data Summarization 

Fall 2008

Instructor: Dr. Masoud Yaghini

## Descriptive Data Summarization

- Motivation
- To better understand the data
- To highlight which data values should be treated as noise or outliers.
- Data characteristics
- Measures of central tendency
- Mean, median, mode, and midrange
- Measures of data dispersion
- Rang, quartiles, interquartile range (IQR), and variance

## Measuring the Central Tendency

Descriptive Data Summarization

## Measuring the Central Tendency

- In this section, we look at various ways to measure the central tendency of data, include:
- Mean
- Weighted mean
- Trimmed mean
- Median
- Mode
- Midrange

## Mean

- Mean: The most common and most effective numerical measure of the "center" of a set of data is the (arithmetic) mean. (sample vs. population)

$$
\bar{x}=\frac{1}{n} \sum_{i=1}^{n} x_{i} \quad \mu=\frac{\sum x}{N}
$$

- Weighted mean: Sometimes, each value in a set may be associated with a weight, the weights reflect the significance, importance, or occurrence frequency attached to their respective values.

$$
\bar{x}=\frac{\sum_{i=1}^{n} w_{i} x_{i}}{\sum_{i=1}^{n} w_{i}}
$$

Descriptive Data Summarization

## Trimmed mean

- Trimmed mean
- A major problem with the mean is its sensitivity to extreme (e.g., outlier) values.
- Even a small number of extreme values can corrupt the mean.
- the trimmed mean is the mean obtained after cutting off values at the high and low extremes.
- For example, we can sort the values and remove the top and bottom $2 \%$ before computing the mean.
- We should avoid trimming too large a portion (such as $20 \%$ ) at both ends as this can result in the loss of valuable information.

## Median

- Suppose that a given data set of $N$ distinct values is sorted in numerical order.
- The median is the middle value if odd number of values, or average of the middle two values otherwise
- For skewed (asymmetric) data, a better measure of the center of data is the median.

Descriptive Data Summarization

## Mode \& Midrange

- Mode is the another measure of central tendency
- The mode for a set of data is the value that occurs most frequently in the set.
- If each data value occurs only once, then there is no mode.
- The midrange can also be used to assess the central tendency of a data set
- It is the average of the largest and smallest values in the set.

## Mean, Median, and Mode

- Mean, median, and mode of symmetric versus positively and negatively skewed data.

(a) symmetric data

(b) positively skewed data

(c) negatively skewed data
- Positively skewed, where the mode is smaller than the median (b), and negatively skewed, where the mode is greater than the median (c).

Descriptive Data Summarization

## Measuring the Dispersion of Data

Descriptive Data Summarization

## Measuring the Dispersion of Data

- The degree to which numerical data tend to spread is called the dispersion, or variance of the data.
- The most common measures of data dispersion are:
- Range
- Five-number summary (based on quartiles)
- Interquartile range (IQR)
- Standard deviation

## Range

- Range: difference between highest and lowest observed values

Descriptive Data Summarization

## Inter-Quartile Range

- Inter-quartile range (IQR): $\mathrm{IQR}=\mathrm{Q}_{3}-\mathrm{Q}_{1}$
-IQR is a simple measure of spread that gives the range covered by the middle half of the data
- Quartiles:
- First quartile $\left(\mathrm{Q}_{1}\right)$ : The first quartile is the value, where $25 \%$ of the values are smaller than $\mathrm{Q}_{1}$ and $75 \%$ are larger.
- Third quartile $\left(\mathrm{Q}_{3}\right)$ : The third quartile is the value, where $75 \%$ of the values are smaller than $\mathrm{Q}_{3}$ and $25 \%$ are larger.
- Outlier: usually, a value higher/lower than $1.5 \times \mathrm{IQR}$

## Five Number Summary

- Five number summary: min, $\mathrm{Q}_{1}$, Median, $\mathrm{Q}_{3}$, max
- Contain information about the endpoints (e.g., tails) of the data
- Boxplot
- Data is represented with a box
- The ends of the box are at the first and third quartiles, i.e., the height of the box is IRQ
- The median is marked by a line within the box
- Whiskers: two lines outside the box extend to Minimum and Maximum
- To show outliers, the whiskers are extended to the extreme low and high observations only if these values are less than 1.5 * IQR beyond the quartiles.

## Five Number Summary

- Boxplot for the unit price data for items sold at four branches of AllElectronics during a given time period.

## Variance and Standard Deviation

- Variance: (sample: s, population: $\sigma$ )

$$
\begin{aligned}
& s^{2}=\frac{1}{n-1} \sum_{i=1}^{n}\left(x_{i}-\bar{x}\right)^{2}=\frac{1}{n-1}\left[\sum_{i=1}^{n} x_{i}^{2}-\frac{1}{n}\left(\sum_{i=1}^{n} x_{i}\right)^{2}\right] \\
& \sigma^{2}=\frac{1}{N} \sum_{i=1}^{n}\left(x_{i}-\mu\right)^{2}=\frac{1}{N} \sum_{i=1}^{n} x_{i}^{2}-\mu^{2}
\end{aligned}
$$

- Standard deviation: $s$ (or $\sigma$ ) is the square root of variance $s^{2}\left(\right.$ or $\left.\sigma^{2}\right)$
- $\sigma$ measures spread about the mean and should be used only when the mean is chosen as the measure of center.
- $\sigma=0$ only when there is no spread, that is, when all observations have the same value.

## Graphic Displays of Basic Descriptive Data Summaries

Descriptive Data Summarization

## Graphic Displays

- There are many types of graphs for the display of data summaries and distributions, such as:
- Bar charts
- Pie charts
- Line graphs
- Boxplot
- Histograms
- Quantile plots
- Scatter plots
- Loess curves

## Histogram Analysis

- Histograms or frequency histograms
- A univariate graphical method
- Consists of a set of rectangles that reflect the counts or frequencies of the classes present in the given data
- If the attribute is categorical, such as automobile _model, then one rectangle is drawn for each known value of A , and the resulting graph is more commonly referred to as a bar chart.
- If the attribute is numeric, the term histogram is preferred.

## Histogram Analysis

- A set of unit price data for items sold at a branch of AllElectronics.

| Unit price (\$) | Count of items sold |
| :---: | :---: |
| 40 | 275 |
| 43 | 300 |
| 47 | 250 |
| .. | .. |
| 74 | 360 |
| 75 | 515 |
| 78 | 540 |
| . | .. |
| 115 | 320 |
| 117 | 270 |
| 120 | 350 |

## Quantile Plot

- A quantile plot is a simple and effective way to have a first look at a univariate data distribution.
- Displays all of the data (allowing the user to assess both the overall behavior and unusual occurrences)
- Plots quantile information
- For a data $x_{i}$ data sorted in increasing order, $f_{i}$ indicates that approximately $100 \mathrm{f}_{\mathrm{i}} \%$ of the data are below or equal to the value $\mathrm{x}_{\mathrm{i}}$
- Note that the 0.25 quantile corresponds to quartile Q1, the 0.50 quantile is the median, and the 0.75 quantile is Q3.

## Quantile Plot

- A quantile plot for the unit price data of AllElectronics.

[^2]
## Scatter plot

- A scatter plot is one of the most effective graphical methods for determining if there appears to be a relationship, clusters of points, or outliers between two numerical attributes.
- Each pair of values is treated as a pair of coordinates and plotted as points in the plane

## Scatter plot

- A scatter plot for the data set of AllElectronics.

[^3]
## Scatter plot

- Scatter plots can be used to find (a) positive or (b) negative correlations between attributes.

[^4]
## Scatter plot

- Three cases where there is no observed correlation between the two plotted attributes in each of the data sets.

[^5]
## Loess Curve

- Adds a smooth curve to a scatter plot in order to provide better perception of the pattern of dependence
- The word loess is short for local regression.
- Loess curve is fitted by setting two parameters: a smoothing parameter, and the degree of the polynomials that are fitted by the regression

## Loess Curve

- A loess curve for the data set of AllElectronics
